

5A, I²C Controlled Output Synchronous Step-Down Converter

DESCRIPTION

The ETA355D is a high-efficiency, DC-to-DC step-down switching regulator, capable of delivering up to 5A of pulse load. It integrates an I²C interface that dynamically scales the output voltages on demand. The DCDC control block belongs to a new breed of high frequency synchronous Step-Down converter that combines the advantages of voltage mode control and Constant-On-Time control. Its adaptive Constant-On-Time control dynamically changes switch on time to achieve a constant switching frequency. It does not have the minimum on-time constrain normally a fixed-frequency current mode Step-down requires, allowing it to go down to very low duty ratio without affecting loop stability. The voltage mode nature also provides a more superior load transient response and a seamless transition from PFM to PWM modes. Cycle-by-cycle current limit provides output short-circuit protection and an input OVP function guards ETA355D against possible input voltage surge. ETA355D is housed in a 2mm x 1.6mm CSP-20 Package.

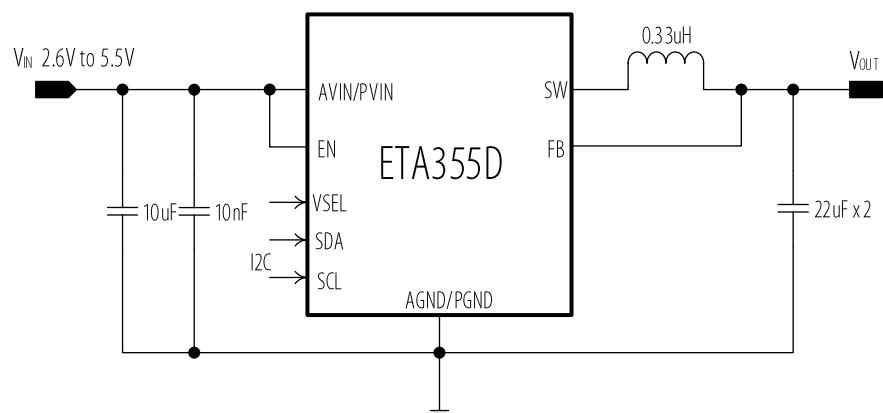

FEATURES

- ◆ I²C Dynamic Output Control
- ◆ Synchronous High Efficiency up to 95%
- ◆ Fast load transient response
- ◆ Capable of Delivering 5A
- ◆ Input OVP at 6.2V
- ◆ No External Schottky Diode Needed
- ◆ Thermal shutdown and UVLO
- ◆ CSP-20 (4x5) package

APPLICATIONS

- ◆ ARM based CPUs
- ◆ Smart Phone
- ◆ Tablet, MID
- ◆ Smart Set-Top Box, OTT

PIN DESCRIPTION

PIN #	NAME	DESCRIPTION
A1	VSEL	Output voltage and mode selection pin
A2	EN	Chip enable control pin, pull high to turn the chip on
A3	SCL	Clock pin for I ² C interface
A4	FB	Feedback Input pin, connect to the output capacitor thru a trace.
B1	SDA	Data I/O pin for I ² C interface
B2, B3, C1, C2, C3, C4	PGND	Power ground for large switching current
B4	AGND	Analog ground, for internal control circuit
D1	AVIN	Analog supply for internal control circuit
D2, E1, E2	PVIN	Power supply for large switching current
D3, D4, E3, E4	SW	Switching node, to connect a 0.33-0.47uH inductor

FUNCTIONAL DESCRIPTIONS

The ETA355D is a high-efficiency, DC-to-DC step-down switching regulator, capable of delivering up to 5A of pulse load. It integrates an I²C interface that dynamically scales the output voltages on demand. The I²C interface can also program the ramp rate output voltage changes and enable or disable the regulator.

DCDC Control scheme

ETA355D uses an adaptive Constant-On-Time control scheme that the ON time is dynamically adjusted according to VIN and VOUT so to achieve a nearly constant switching frequency. This control scheme provides simpler compensation and superior transient response over traditional constant frequency current mode control, while still maintaining the advantage of switching at a constant frequency at about 2MHz. It also provides a seamless transition from PFM to PWM that normally a constant frequency current mode control scheme is hard to achieve. Further mode, because it is a COT control scheme, the system can achieve high step-down ratio at ease, because lower constrain on the minimum on-time requirement existing in constant frequency scheme.

Default Output Voltage when Reset by Toggling EN

ETA355D will not keep previous output voltage setting when being reset by EN pin. When EN is set from 0 to 1, the output voltage will always be the default value, which is 1.1V.

Current Limit and Short-Circuit protection

ETA355D employs a cycle-by-cycle peak current limit and it also has a hiccup mode that protects the circuit during dead-short condition. When the dead-short condition is removed, the IC goes back to normal operation.

Enable and Soft-start

ETA355D has an internal soft-start circuitry to reduce supply inrush current during startup conditions. When the device exits under-voltage lockout (UVLO), shutdown mode, or restarts following a thermal-overload event, the soft-start circuitry slowly ramps up current available at SW.

EN logic low level that sustains shorter than 500ns, won't shutdown IC

Table 1.

Pins		BITS		
EN	VSEL	BUCK_EN0	BUCK_EN1	OUTPUT
0	X	X	X	OFF
1	0	0	X	OFF
1	0	1	X	ON
1	1	X	0	OFF
1	1	X	1	ON

When Out_dis bit in addr 02h is enabled(logic high) and EN pin or BUCK_ENx is low, a load is connected from V_{out} to GND to discharge output capacitor.

Output voltage programming

$$V_{out} = 0.603V + 12.75mV \cdot B<5:0> \text{ (Addr 00h/01h)}$$

VSEL pin=0, Addr 00h controls V_{out} setting; VSEL pin=1, Addr 01h controls V_{out} setting. The IC works in forced PWM mode when MODEx=1; it can operate in auto PFM mode when the load is light and MODEx=0.

Transition Slew Rate

When transitioning a low to high voltage, the slew rate of the IC can be programmed using the SLEW BITS.

Table 2.

Decimal	SLEW<2:0>	Slew Rate	
0	000	64	mV/us
1	001	32	mV/us
2	010	16	mV/us
3	011	8	mV/us
4	100	4	mV/us
5	101	2	mV/us
6	110	1	mV/us
7	111	0.5	mV/us

For output voltage transition from high to low, the discharging speed depends on output load. So in light load, if a faster transition speed is needed, one can set B3(addr 02h)=1. This brings the IC into the forced PWM mode, thereby helping V_{OUT} discharging. For even faster slew setting, B6(Addr 00/01h) can be set to 1 to keep the IC in forced PWM longer for V_{OUT} discharging.

UVLO and Thermal Shutdown

If IN drops below UVLO threshold, the UVLO circuit inhibits switching. Once IN rises above UVLO threshold, the UVLO clears, and the soft-start sequence activates. Thermal-overload protection limits total power dissipation in the device. When the junction temperature exceeds T_j= +155°C, a thermal sensor

forces the device into shutdown, allowing the die to cool. The thermal sensor turns the device on again after the junction temperature cools by 20°C, resulting in a pulsed output during continuous overload conditions. Following a thermal-shutdown condition, the soft-start sequence begins.

REGISTER DESCRIPTIONS
